KEY AREAS ON DELSU POST UTME

"A guide to succeeding in Delta State University
Post Utme "

Written by:

I. N. Precious

Dedication

This book is dedicated to God almighty who has given me the grace to write this E-book.

About The Book

This book centers around key areas on Delsu post utme past Questions. It analyses areas on verbal reasoning, English language, quantitative reasoning, aptitude test and mathematics. This book is really an eye-opener. It guarantees success in the examination.

Table Of Content

This book is grouped into four themes which are outlined below:

1. English Language

A. Rules of Concord

B. Synonyms and Antonyms

2. Verbal Reasoning/ Aptitude Test

A. Anagram

B. Word Analogy

C. Simile

D. Odd-one out

E. Logical reasoning

3. Quantitative Reasoning

A. Number Series

B. Coding and Decoding

4. Mathematics

A. Roman Numeral

B. Word Problems

THEME ONE

ENGLISH LANGUAGE

A. RULES OF CONCORD

Concord is a very important aspect that needs to be considered when preparing for an exam that involves English Language. Scaling through Jamb Utme English questions, you would definitely see a lot of questions on Concord. Are you surprised? Probably you just don't know what Concord means. Post Utme

exams involving English language aren't left out of these too.

What then is Concord?

Concord generally means agreement.

Agreement is the relationship between a subject and its verb, or between a number or determiner and its noun.

This implies that Concord shows the harmony between a Subject in a sentence and the verb. We can't just pick any how verb when filling in the gaps in a sentence without it agreeing with the subject of that sentence. Hence, the need to really understand the term 'concord' and its rules.

Let's examine some rules of Concord.
We would study about 24 of them.
Although, there are numerous of them.

Rule 1

Subject and verb concord

When the subject in a sentence is singular, the verb should also be singular.

For example,

1. She (singular subject) goes (singular verb), not: She go (plural verb). Also, when the subject is plural, the verb should be plural.

2. The girls (plural subject) go (plural verb), not The girls (plural subject) goes (Singular verb).

Note: 'Goes' is a singular verb and 'Go' is a plural verb.

Rule 2

Subject and Object concord

When everybody or everyone is used, the object must be singular, not plural.

For example

1. Everybody knows his or her name, not:
Everybody knows their name.

Rule 3

Mandative subjunctive concord

When prayer, suggestion, wish, demand, recommendation, or resolution is used in a sentence, the verb that follows must be

plural, whether the subject is singular or plural.

For example;

1. It has been suggested that he go not goes away.

2 The board has Recommend that the manager resign not resigns.

3 I pray that God help me on my upcoming examination, not God helps.

Rule 4

The Principle of proximity

This principle states that when there is a list of nouns or pronouns at the level of the subject, it is the nearest noun or

pronoun to the position of the verb that will determine the choice of the verb.

E.g

If James fails his examination, his teachers, his parents, his friends, or John () to be blame.

The correct option to fill that blank space is, “is” not “are” because, at the subject level, we have his teachers, his friends, his parents and John (four different people).

In order to choose the correct verb, we will need to choose the nearest subject to the gap as the subject, which is John.

Note: what makes us consider the only one noun or pronoun used in this

sentence is because of the use of “or.”
However, if the conjunction used is
“and,” all the nouns or pronouns used in
the sentence will be considered as the
subject. I’ll explain better when I get to
the type of such concord.

Back to James.

But if the question comes in this manner,
the answer will be different,

For example,

If James fails his examination, his
teachers, his parents, his friends, or I ()
to be blame.

The correct answer here is “am,” because
the pronoun “I” is the nearest subject to
the gap, so if “I” is the subject, the verb

that goes with it, is “am.” – the 24 rules of concord.

Rule 5

Many – a concord

When many – a is used, the verb and the noun that follows must be Singular

E.g

Many a candidate (not candidates) speaks
(not speak) bad English expressions.

Many a girl (not girls) is (not are) here.

The actual meaning of statements 1 and 2
are many candidates and many girls.

Rule 6

A pair of concord

When “a pair of” is used, the verb must be singular.

For example,

A pair of trousers (not trouser) lies(not lie) on the bed.

A pair of scissors lies (not lie) on the table.

Rule 7

National Concord

National concord is also called collective noun concord.

A collective noun: is a noun that stands for many units that constitute that single word.

For example,

An audience which means people who watch programs.

The congregation, which means worshipers.

Clergy which means religion officers.

A club, which means the association of members.

So whenever, you use a collective noun, the verb that follows must be a plural verb

For example,

Club: is a collective noun for members, so, we can also say, members of this association.

Our club meet (not meets) ones in a week.

However, in some situations, a singular verb goes with a collective noun. Here is the principle;

If the collective noun performs an action, a plural verb follows, but if not, a singular verb follows.

Our Club is celebrating its twentieth anniversary today.

In the above statement, you can see that; Our Club performs no action, hence, a singular verb is used.

But;

Our Club are (not is) going on a vacation tomorrow.

You can see that; the above sentence is different from the first sentence, here the club is performing an action “going,” hence, we will use a plural verb (are) in compliance with the rule.

The audience are (not is) partial in their judgment of the winner. The answer is “are” because the collective noun (audience) performs an action “judgment.”

Rule 8

Parenthesis

The parenthesis statement is an additional statement to what has already been said before.

Note A parenthetical statement should not be considered in choosing the verb that will follow.

E.g

The teacher, not her students is in the class.

The correct answer is, is because (not her students) is just parenthesis, and parenthesis has nothing to do with choosing the verb.

Rule 9

Accompaniment Concord

When any of these following words are used, the subject of the clause would be the noun and pronoun that comes before the marker of accompaniment.

Words like as much as, alongside, as well as, together with, no less than, in association with, including, like, with, and in collaboration with, etc

Example 1

Mary, as well as her friends, is (not are) beautiful.

The answer is, “is” because mary is the noun that comes before as well as, hence mary is the subject and it is a singular noun hence a singular verb.

Rule 10

More than concord

When more than is used, the word or number that comes after more than will determine the next verb.

For example:

More than two apples are (not is) here.

Note: Do not think because more than one means at least two, that you will use a plural

verb after, no, you will use a singular verb – the 24 rules of concord.

Rule 11

Indefinite pronoun concord

When any of the following words are used, you should use a Singular verb

Such words as; Everybody, everything, everyone, everywhere, no one, nothing, nobody, nowhere, something, someone, somebody, anyone, anything, anybody, anywhere and each. the next verb must be singular.

For example:

Nothing goes (not go).

Everybody likes (not like) him.

Everybody thinks (not think) he stole the money.

Rule 12

Relative Concord

When who, whose, which and that refers to a previously mentioned noun or pronoun, such noun is a Relative noun

Example:

One of the farmers who plant (not plants) on the farm has (not have) been asked to withdraw.

Rule 13

Uncountable nouns of concord

Note all uncountable nouns will avoid “s” at the back.

It is wrong to use any of these words below;

E.g informations, clothes, equipments, furnitures, machineries, datas, advices, evidences, wealths, and so forth.

Instead, you say a piece of, information, evidence, data, cloth, equipment, advice, etc

It is wrong to say machineries instead, you say a machine or two machines.

Rule 14

Pluralia tantums

Pluralia tantum are nouns that come in plural forms.

Some of these words have final “s”, while some do not. However, whenever any of the

following forms appear, it must be followed by a singular verb.

School Subject: Mathematics, Economics, Civics, Physics, Statistics, and so forth. You can see that all of the words end with “s” but it does not show plurality.

Games: Darts, Snakes and Ladders, Draughts, Billiards, Bowls and Skittles, and so forth, all end with “s” but do not show plurality.

Diseases: Measles, Tuberculosis, Shingles, Mumps, and so on, all end with “s” but do not show plurality.

Others: titles, news, series, means, and so forth.

Rule 15

Double title subject concord

When two subjects are joined together by “and” but the two subjects refer to only one person or thing, a singular verb should be used.

Example:

Our principal and mathematics teacher knows me.

Rule 16

Co-ordinate concord

When two subjects are joined together by and, the verb to be used should be plural.

Examples:

James and John are (not is) here.

Rule 17

Categorization concord

When a collective name, denoting category (not a collective noun) is used, the verb to be used must be plural.

Categories like: the poor, the rich, the wealthy, the successful, the gifted, the weak, the young in spirit, the handicapped, the helpless, and so forth. The verb to be used should be plural.

Examples:

The poor need help (not helps or needs) from the government.

Rule 18

Plural number concord

When amount or unit is mentioned in a statement, units such as five thousand, three

hundred, percent, twenty meters, five times, and so on. The next verb must be singular.

Examples:

Two pounds of flour is (not are) too few to bake a cake.

Rule 19

Mathematical facts

When mathematical facts are used, such as subtraction, multiplication, addition, division, and so forth, are used, the verb will be any of Singular and plural, that is, a singular or plural verb can be used when mathematical facts are used.

Rule 20

Every + plural number concord

When every precedes a plural, the next verb is plural.

Rule 21

Most or much concord

When most is used, the verb will either be singular or plural, depending on whether the referent is a countable or uncountable noun.

Rule 22

All concord

When all appears, it means either everything or all the people.

When all means everything, the verb to be used should be Singular but when all means all the people, the verb to be used should be plural.

Rule 23

Either or neither concord

When either or neither joins two singular nouns together, the following verb should be Singular.

Rule 24

Each and one of concord

When each appears in concord, a singular noun + a singular verb will be chosen.

Example:

Each boy (not boys) has a car.

B. SYNONYMS AND ANTONYMS

Synonyms and antonyms is another aspect of English language in which Delsu must set questions on. For you to be able to defeat this area, I suggest you learn at least 10 vocabulary in a day. All you need to do is to get an exercise book, each day write out 10 new words. You can pick out these words from WAEC or JAMB past questions. Write out their meanings plus their antonyms and synonyms and study them that day. Do this often and often. Try and ask yourself questions on them.

Listen, if you try this technique for at least 1 month before the exam, you should have mastered about 300 words; their antonyms and their synonyms.

Wow! It's amazing right? So, there is no how you won't come across any of those words in the post Utme exam. It's either you are asked for the antonym or synonym of that word.

So, imagine trying it out for about 2 months before the exam. Wow! You become a dictionary yourself.

What are Synonyms?

Synonyms are words which are similar in meaning. Their dictionary meaning are closely related. Thereby, a single word can carry many synonyms.

What are Antonyms?

Antonyms are words which are opposite in meaning. Their dictionary meaning are opposite related. Thereby, a single word can carry many Antonyms.

TIPS ON HOW TO SOLVE QUESTIONS ON SYNONYMS

1. If one does not know the exact meaning of the word, try understanding it in the context of the paragraph. Try getting the contextual meaning.
2. In case the meaning of the word is not clear, going through all the available options can certainly be considered as a good idea. By doing so, one can start getting idea about the given question &

start negating the available options one after the other.

3. Sometimes it so happens that a particular word sounds more like a tongue twister, so try & break it into meaningful parts. Chances are there that the full word might start making more sense in this way.

4. One of the effective ways of knowing & scoring well in this section is to keep a notebook with a lot of vocabulary written there. Revising the list regularly helps one in remembering the synonyms more often.

5. While replacing a particular word in sentence, using its synonym, please see

to it that the context does not change nor the whole meaning of the sentence.

This above tips also applies when solving questions on Antonyms.

THEME TWO

VERBAL REASONING

A. ANAGRAM

Anagram is one of the common question of DELSU POST UTME EXAM . So what is Anagram?

Anagram is a rearrangement of the letter of one word or phrase to form another word or phrase.

For example we can rearrange MEAT to form MATE. What we simply do is to change the position of the letter M E A T to M A T E.

Lets see these examples

Identify the anagram to the given word

1. EARTH

A Planet B Ear C Heart D Universe

2. DIET

A Food B Die C Tied D Nutrition

3. ANGELS

A Sang B. Angles C Lean D Holy

So let analyse the answer to each questions

1. in question 1,

I. EARTH contains 5 letter. Only option c Heart contains 5 letter

II. The types of letter in EARTH is exactly the same to what we have in Heart. Hence option C is the correct answers

2. in question 2,

I. DIET contains 4 letter. Option A and C contains 4 letter

II. The types of letter in DIET is exactly the same to what we have in Tied. Hence option C is the correct answers

3. In question 3, following the same pattern, the correct option is B.

Now, do we understand the concept of anagram? It's simple right?

B. WORD ANALOGY

Analogy generally means comparison. It is the comparison between one thing and the other typically for the purpose of clarification or explanation. It shows the similarities between two things. An analogy explains one thing in terms of another to highlight the ways in which they are alike.

Analogy is another aspect in which Delsu sets questions on.

The word analogy questions are always similar to the example below.

Example:

Fast is to Running as Slow is to ?

Answer options:

A) Walking

B) Pace

C) Turtle

D) Lazy

Explanation:

If running is fast, then walking is slow – walking is the correct answer.

Now, we have seen how questions on analogy looks like.

One way to solve questions on analogy is by a method called elimination method.

The best way to answer questions that might be difficult and pose a doubt in your mind is doing elimination. The format of the test is generally objective with the candidate being asked to choose the right answer. Only one of the given answer choices will be correct. When uncertain, you should find out the option that has the least probability of being the correct one and eliminate it. Repeatedly striking the least probable choices will leave you with fewer options that may make it easier for you to find out the right one. Moreover, difficult answers

should only be attempted once the candidate has completed all other questions.

Examples:

Q.1. _____ : trail :: grain : grail

(A) train

(B) path

(C) wheat

(D) holy

The first step to answer this question is to compare. If grain is equal to grail, then, trail would be equal to?

It is glaring that trail would give us **train** since the letter 'l' in grail was changed to letter 'n' in grain.

Q.2. Candle : Wax :: Paper : ?

- (A) Wood
- (B) Tree
- (C) Bamboo
- (D) Pulp

Let's analyse this question. Wax is the raw material which gives rise to Candle. What then is the raw material used in making Paper? Of course, it is **pulp**.

Try and solve more questions relating to word analogy. It is so easy.

C. SIMILE

A simile is a figure of speech that compares two different things. I guess we are familiar with questions on similes. It involves comparing a particular thing to another thing different. For example, if I say your book is white as a snow, that's a simile.

Examples of Similes:

As sharp as razor

As dirty as a pig

As easy as pie

As sweet as sugar

As busy as a bee

As brave as a lion

As black as coal

As big as an elephant

As clear as crystal

As simple as ABC

As cold as ice

As dead as a door nail

As for as a fiddle

As dry as a bone

As heavy as a lead

As loose as a goose

As sour as vinegar

As straight as an arrow

As bitter as gall

As slippery as an eel

As quick as lightening

As silent as a grave

As poor as a church rat

As playful as a kitten

As proud as a peacock

As old as the hills.

Do well to learn more Similes.

D. ODD-ONE OUT

This is another vital aspect one need to learn. Usually, some options are given and one is asked to pick the odd one out.

Let's see some examples.

Pick the odd one out

1.

1. Dollar 2. Peso 3. Ounce 4. Euro

Look at the options above, if you notice, Dollar, Peso and Euro are all currencies. Ounce is a measurement of weight. So, the odd one is **Ounce**.

2.

1. Geometry 2. Algebra 3. Calculus. 4.
Force

The answer is **Force** since the rest are all branches of mathematics.

3.

1. Spoon 2. Knife 3. Sword 4. Fork

The answer is **Sword** since others are used in the kitchen.

Picking the odd one is a very easy aspect especially if you are familiar with a lot of registers. Registers are word that are peculiar to a particular field. For example, registers on Food include: rice, beans, yam and so on. Registers on Sports include: Basketball, Volleyball, Tennis and so on.

Also, you need to know a lot of vocabularies to be good in this aspect.

For example:

Pick the odd-one out.

A. Wicked B. Evil C. Good D.

Mischievous

The odd one is **Good**. The rest are synonymous to each other. If you weren't familiar with those words, you won't be able to pick the odd-one out.

E. LOGICAL REASONING

Logic reasoning involves drawing a conclusion from a set of statements.

Logical reasoning is one of the fundamental skills of effective thinking.

It works by raising questions like:

If this is true, what else must be true?

If this is true, what else is probably true?

If this isn't true, what else can't be true?

Example:

If there is someone at the door, the dog will bark.

Assuming this sentence holds true, there are some other sentences that must also be true.

If the dog didn't bark, there is no one at the door.

Just because the dog barked doesn't mean there's someone at the door.

There are also a few sentences that are probably true, such as:

The dog can sense (hear or smell) when someone is at the door.

The dog belongs to the people who live in the house where the door is located.

All these analysis, are a product of logical reasoning.

Let's solve some questions on logical reasoning. I would encourage you to

search for more questions using your past question.

Example 1:

Statements:

1. All mangoes are golden in color.
2. No golden-colored things are cheap.

Conclusions:

- I. Mangoes are cheap.
- II. Golden-colored mangoes are not cheap

Options:

- A. Only conclusion I follows
- B. Only conclusion II follows
- C. Either I or II follows

D. Neither I nor II follows

E. Both I and II follow

What is the answer?

Since, all mangoes are golden and no golden-colour things are cheap, this implies that Mangoes are not cheap.

Conclusion I does not agree with this.

Conclusion I agrees with this. Hence, the answer is option B.

Example 2:

Statements:

1. Some kings are queens.
2. All queens are beautiful.

Conclusions:

- I. Kings are beautiful.

II. Queens are kings.

Options:

A. Only conclusion I follows

B. Only conclusion II follows

C. Either I or II follows

D. Neither I nor II follows

E. Both I and II follow

What is the answer?

From the statement, some Kings are queens and all queens are beautiful. This doesn't mean that Kings are beautiful and this doesn't mean that all queens are Kings. Hence, both conclusions don't agree with the statements. Hence, option D is correct.

I'm sure we now have a little
understanding on logical reasoning.
Practice some more examples.

THEME THREE

QUANTITATIVE REASONING

A. NUMBER SERIES

Number series aptitude questions present you with mathematical sequences that follow a logical rule, based on elementary arithmetic.

In these questions a sequence of numbers called ‘terms’ are presented, with 1 or more missing element(s).

You are then asked to find the rule that connects them to each other. After you

have detected the rule, you can then deduce the missing number.

This is one of the areas in which Delsu sets questions on.

When you are given questions on number series to solve, you have to check if it is:

1. Arithmetic Sequence: In arithmetic sequence questions, you will find that the differences between the numbers are obtained by adding, subtracting or performing both operations to the previous term.

Example:

5, 9, 13, --, --, ? Find the two missing numbers.

The difference between 9 and 5 is 4. And the difference between 13 and 9 is 4. So, you can see that each number is gotten by the addition of 4. So, the next two terms would be $13+4$ which is equal to 17 and $17+4$ would be equal to 21.

2. Geometric Series:

In this type, the series progresses with addition or subtraction of some specific numbers. Here the **RATIO** between any successive terms is large, increases in a specific manner and is constant throughout the series.

Example:

3, 9, 27, --- Find the missing number.

If you notice, the difference is quite large compared to that of arithmetic series. The next term is gotten by the multiplication of 3.

3 times 3 gives 9

9 times 3 gives 27

27 times 3 gives the missing number.

3. Division Series: In this type of series, each term is divided by a fixed number or specific number pattern to get the next successive number.

Example: 128, 64, 32, 16, 8, -- Find the missing number.

If you notice this series, each term is divided by 2 to give the next term.

$128/2$ gives 64

$64/2$ gives 32

$32/2$ gives 16

$16/2$ gives 8. Hence, the missing term is 8.

4. Square Or Cube Series:

This type of numbers series progresses with squaring or cubing of the numbers.

Example: 4, 16, 36, 64, ---? Find the missing number.

If you notice;

4 is the square of 2

16 is the square of 4

36 is the square of 6

64 is the square of 8.

-- is the square of 10 (since the numbers are even).

Hence, the missing number is 100.

This also applied in the case of cubes.

5. Product series: In this type of series, each term is multiplied by a fixed

number or specific number pattern to get the next successive number.

Example:

2, 4, 8, --- Find the missing number.

The numbers are multiplied by 2 to give the next term.

2 times 2 gives 4.

4 times 2 gives 8.

Hence, 8 times 2 gives 16.

16 is the missing number.

B. CODING AND DECODING

Coding is a method of transmitting a message between the sender and the receiver that no third person can understand it. The coding and decoding one's ability of deciphering the rule and breaking the code to decipher the message will be tested to know.

Approach:

- 1) Observe alphabets or numbers given in the code keenly.
- 2) Find the sequence it follows whether it is ascending or descending.
- 3) Detect the rule in which the alphabets/numbers/words follow.
- 4) Fill the appropriate letter/number/word in the blank given.

Letter coding:

Alphabets in a word are replaced by other alphabets according to a specific rule to know its code. So the common rule should be detected first. Some examples are given below:

1) 'ZYXW' as coded as 'ABCD' then 'STUV' is coded as.....

Answer: Z – A, Y – B, X – C, W – D

V – E, U – F, T – G, S – H

STUV = HGFE

Answer = HGFE

Rule= front alphabet= back alphabet.

2) 'bcd' is coded as 'def' then 'True' is coded as.....

Solution:

b – d

c - e

d - f

This implies that the next two alphabets after an alphabet is equal to that alphabet.

+2 letters are considered in this code.

True – Vtwg

Answer = Vtwg.

3) ' Hyderabad ' is coded as 'Ixedszcze'
then 'Chennai' is coded as.....

Answer: H – I (+1) the next alphabet

Y – X (1–) the previous alphabet

D – E (1+) the next alphabet

E – D (1-) the previous alphabet

R – S (1+) the next alphabet

A – Z (1–) the previous alphabet

B – C (1+) the next alphabet

A – Z (1–) the previous alphabet

D – E (1+) the next alphabet

Here if we observe alternatively the letter
increasing and one letter decreasing.

Chennai =dgfmzj

Answer = dgfmzj

Number coding: In this each alphabets or words are assigned to the numeric values we should observe the given letters and the assigned values and use the same rule to find the value to of given code. Some examples are given below:

1.

In a language A is coded as 1, B is coded as 2, then FACE is coded as

Since A is 1 and B is 2, it implies that C is 3 and so on....

Thus, FACE is coded as 6135.

2.

Apple is coded as 25563, Rung is coded as 7148. Then purple is coded as

Answer:

PURPLE – 517563

Answer = 517563.

Substitution:

In this section an object names are substituted with different object names. We should carefully trace the substitution and answer given question. Some examples are given below:

1)'book' is coded as 'pencil', 'pencil' is coded as 'mirror', 'mirror is coded as 'book'. Then what is useful to write on a paper?

Answer: Pencil is coded as mirror

Answer = mirror.

2)'man is coded as 'woman', woman is coded as 'girl', 'girl' is coded as 'boy', 'boy' is coded as 'worker' then 6 years female is known as?

Answer: 6 years female = girl, but 'girl' is coded as 'boy'.

Answer = boy.

3)'Reds' are 'blues', 'blues' are 'whites', 'whites' are 'yellows', 'yellows' are

‘oranges’, ‘oranges’ are ‘pinks’, then what is the colour of the sky?

Answer: Sky is blue, but blues are whites

Answer = white.

THEME FOUR

MATHEMATICS

A. ROMAN NUMERAL

A Roman numeral is a number written using the Roman numbering system. This system uses the letters I, V, X, L, C, D, and M

instead of the numbers 1, 2, 3, 4, 5, 6, 7, 8, 9, and 0. To read a Roman numeral, you go from left to right and you interpret each letter according to this chart.

Roman Numeral	Decimal Equivalent
I	1
V	5
X	10
L	50
C	100
D	500
M	1000

Just like your regular numbers go from larger to smaller, so do your Roman numerals. You'll have your letters representing your largest numbers first and then they go down from there. As you read, you add your values up. So VI is equal to $5 + 1 = 6$. The only time you'll have a smaller letter in front of a larger letter is when you need to subtract the smaller letter from the larger.

In Roman numerals, you can't have three of the same letters in a row. To write the number 4, you write IV instead of IIII. Since you have the smaller I in front of the V, it tells you to subtract, so you get $5 - 1 = 4$. You can't write IIII since you have 4 I's in a

row. You can only have a maximum of 3 I's. So a number 3 is III.

Solving Problems with Roman Numerals

To solve problem with Roman numerals, you actually perform an extra step in the beginning and an extra step at the end. All your other steps are exactly the same as when you are working with regular numbers. What are these extra steps? The first extra step is you converting your Roman numeral to a regular number and your second extra step is you converting your answer to a Roman numeral.

Here are your steps:

Convert your Roman numerals to decimal numbers.

Solve your problem as normal.

Convert your answer back to a Roman numeral.

Example 1

What is the answer to $XIV + XXI$?

To solve this problem, you first convert your Roman numerals to decimal numbers. Your XIV converts to $10 + 5 - 1 = 14$. Here, since you have the smaller letter I in front of a larger letter V , you subtract it from the larger. Your XXI converts to $10 + 10 + 1 = 21$.

Now, you can go ahead and solve $14 + 21$ as normal. You get $14 + 21 = 35$.

Last, you convert this back to a Roman numeral. Your 35 becomes XXXV. You need three 10s or three Xs to make 30 and then you a V for a 5.

So, your answer is XXXV.

Example 2:

What is the answer to XXII divided by II

XXII in decimal means 22

II in decimal means 2.

Hence, $22/2$ gives 11.

Converting 11 to Roman numeral gives XI.

This, XI is the answer.

B. WORD PROBLEMS

Numerical Word Problems, also simply called math word problems, are mathematical questions presented in a verbal format. The questions will assess your mathematical ability and your logical reasoning.

Example:

1. At a toy factory it takes two machines 50 minutes to create 10 teddy bears. How many teddy bears can one machine create in 30 minutes?

Answer options:

A) 6

B) 5

C) 3

D) 2

Explanation:

First find how many teddy bears one machine can create in 50 minutes:

$$10 \div 2 = 5$$

Now find how long it takes one machine to create 1 teddy bear:

$50 \div 5 = 10$ minutes per teddy bear At last find how many teddy bears the machine can create in 30 minutes:

$$30 \div 10 = 3 \text{ teddy bears}$$

When solving word problems, you should take note of some key words.

The table below indicates the meaning of some of the keywords.

When you see	Think
add, total, sum, increase, more, combined, together, plus, more than	+
minus, less, difference, fewer, decreased, reduced	-
multiplied, times, of, product, factor	×
divided, quotient, per, out of, ratio, ratio, percent, rate	÷
Rate, speed	Distance formula
How long, days, hours, minutes, seconds	Time

Solving word problems in mathematics requires logical reasoning. Try solving some

word problem questions in the post Utme past questions.

FINAL NOTE

If you can dedicate your time to study this book alongside with the Delsu past questions, I guarantee you success in your forthcoming exam. Good luck!
